

**iPhone personal hotspot not visible**

**Continue**

Many things can cause your iPhone Personal Hotspot to stop working. We include information about why Personal Hotspot might be having problems and each solution below. These are the most common causes and ways to fix an iPhone Personal Hotspot that isn't working. If your iPhone Personal Hotspot isn't working, follow these suggestions—in this order—to get it working again. These instructions apply to all iPhone models running iOS 13 and up. For older versions of iOS, the basic ideas are the same, but the exact steps may differ. Turn Personal Hotspot Off and On. Sometimes you need to reset your Personal Hotspot to get it working again. Do that by turning it on and off: Tap Settings > Personal Hotspot > move the Allow Others to Join slider to off/white and then back to on/green. Turn Cellular Data On and Off. The problem with Personal Hotspot might be related to your iPhone's connection to cellular data networks. If your phone is having trouble connecting to those networks, Personal Hotspot might not work either. Reset your cellular data connection by turning it on and off: Tap Settings > Cellular > move the Cellular Data slider to off/white and back to on/green. Restart iPhone to Fix Personal Hotspot. You'd be surprised how often a simple restart of your iPhone will fix all kinds of problems. Consult our instructions on how to restart every iPhone, from the first generation to the latest model, in the link above. Update iOS. Every new version of the iOS—the operating system that runs on the iPhone—includes bug fixes. Your iPhone's Personal Hotspot might not be working due to a bug that's fixed by an iOS update. Install the latest version of iOS to see if it fixes your problem. Enable Maximize Compatibility on iPhone 12 Series. The iPhone 12 series phones have some different networking features and options than earlier devices, including 5G. These options can sometimes cause a problem for older models connecting to them. Solve this by going to Settings > Personal Hotspot > move the Maximize Compatibility slider to on/green. Update Carrier Settings to Fix Personal Hotspot. Every iPhone has a hidden set of carrier settings. These settings help your iPhone work with your phone company. Carriers issue updates from time to time, though not as often as iOS updates. If Personal Hotspot isn't working, check for and install available carrier settings updates. Confirm Your Phone Plan Includes Personal Hotspot. Have you changed your phone plan recently or switched phone companies? Personal Hotspot might not be working because your plan doesn't include it. Most phone companies' data plans include Personal Hotspot these days, but some don't. You may also be able to remove the feature. So, before you do anything else, log into your phone company account and make sure your plan includes Personal Hotspot. If it doesn't, add it. Reset Network Settings. The iPhone stores network settings that help control how you connect to Wi-Fi, cellular, Bluetooth, and other networks. If a problem crops up in your Network Settings, it can cause the Personal Hotspot to stop working. Reset your Network Settings to solve the problem. Make Sure There Are No Problems With Your Phone Company Account. Personal Hotspot not working could be due to a problem with your phone company account (such as an overdue bill or error on the company's part). If nothing else on the list has helped so far, check your online phone company account or call your phone company to see if they can help. Restore iPhone with DFU Mode. If you've gotten this far without a fix to a Personal Hotspot that's not working, it's time for more drastic steps. One of those is to restore your iPhone using DFU Mode. DFU, or Disk Firmware Update, Mode lets your iPhone start up but doesn't boot up the iOS. Because that, it enables you to fix iOS at a lower level that can sometimes solve very tricky issues. Begin by making a backup of your iPhone, so you don't lose any data. Then put your iPhone into DFU Mode and restore it to see if a fresh start fixes the problem. Of course, these tips only work if your Personal Hotspot is visible. In some cases, the option can disappear entirely from your iPhone. We can also show you how to fix a missing Personal Hotspot. At this point, if Personal Hotspot still isn't working, it's time to bring in the experts. You can contact Apple for tech support over the phone or make an appointment for in-person support at your local Apple Store. If anyone can help with a problem this stubborn, it's Apple. FAQ How do I make my iPhone hotspot faster? Turn on Maximize Compatibility and move your other devices closer to your iPhone. If necessary, update your iPhone to the latest version of iOS. How do I check my hotspot usage on iPhone? To check your iPhone hotspot's data usage, go to Settings > Personal Hotspot. Tap a connected device to see how much data it has used. How do I change the hotspot name on my iPhone? To change your hotspot's name, you must change the name of your iPhone. Go to Settings > General > About > Name. Tap X next to the current name, then enter a new one. How do I change my iPhone hotspot password? Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why! A specific geographic location in which an access point provides public wireless broadband network services to mobile visitors through a WLAN. Hotspots are often located in heavily populated places such as airports, train stations, libraries, marinas, conventions centers and hotels. Hotspots typically have a short range of access. Also see hot spot. See Public Wi-Fi Hotspots in the Quick Reference section of Weopedia. There's something admirable about genuinely miserable people, the kind of people that greet the dawning of a new day by asking, "how can I really ruin this day for everybody?"The kind of people who see everyone as money pongies they can squeeze to get a bit more cash.The kind of people who run mobile phone networks.iOS 4.3 is here, and that means Personal Hotspots: the ability to turn your iPhone 4 into a Wi-Fi access point for devices such as your computer or your iPad. It's just like sticking a Wi-Fi router on your home broadband, and it's a feature Android already offers.Now, you'd think that since iPhone data plans are so ridiculously, ruinously expensive, and since almost all of them have a cap on the amount of data you can use each month, the personal hotspot feature would be free.You'd be wrong.With the honourable exception of Three, it seems that if you want to use your iPhone as a hotspot and you're not on a million quid per month data plan, you'll pay extra for it.Why?Data is data!There've seen suggestions that the networks are worried about data hogs: people will connect their laptops to their iPhones and immediately download Windows Service Packs, AV updates and Blu-Ray rips.If only there was a way of penalising such customers, for example by setting a limit on how much data they could download in a month. The networks could mess with them while we're at it by calling it "unlimited data" when it's really half-a-gig.Deterring data hogs is the only reasonable explanation for making you pay extra for tethering on an iPhone, but we already have a deterrent in the form of data caps - and you don't pay for personal hotspots on Android devices. So what's different here?There are only two possible explanations.One, iPhone data is a different shape from Android data. It's triangular, or maybe octagonal, and it gets stuck in the internet tubes.Or two, the networks are bastards.I know, I know. It's a tough one.Imagine if ISPs behaved like this. On a typical day my broadband connection is used by a MacBook Pro, an Acer Aspire, a PC I made out of old bits of wood and string, an iPhone 3GS, an iPhone 4, an iPad, an Apple TV, an Xbox 360 and quite possibly my next-door neighbours, the postie and the milkman. By phone firm logic I should be paying a surcharge for that, or several surcharges.By phone firm logic I should be paying extra if I put a call on speakerphone.Data is data. Provided you don't exceed your data limit or bring down the network, what you do with that data when it leaves the mobile phone network is none of the operator's damn business. Charging for tethering on a capped data plan is profiteering, plain and simple.Maybe the networks realise that. O2 told us earlier that their new tariffs, which will be announced in the next few weeks, will include tethering as part of your data allowance - and that existing customers would be able to get those tariffs. The cynic in me says "yeah, provided you sign up for another 24 months". I hope I'm wrong.If you want a personal hotspot, don't pay for it. Wait and see what new tariffs emerge, whether the operators will let you move to them without signing away your eternal soul, and whether the various networks realise how greedy they're being when they ask you to pay twice for your data.And if they still expect you to pay extra for tethering?/jailbreak your iPhone. If you're traveling with a tablet or notebook, it can be difficult to find a reliable, secure Wi-Fi network. But if you have your iPhone and a strong 4G signal, you have instant access to a personal hotspot — letting you bypass weak, insecure or slow public Wi-Fi networks. All the latest models of the iPhone — since the iPhone 3G — have built-in hotspot capabilities. Follow these steps to turn on your iPhone's mobile hotspot, and never be without Wi-Fi again. First check with your mobile carrier The first step is to check with your mobile carrier — some companies impose data limits, or they will ask you to purchase an additional plan. Verizon includes mobile hotspot access for no additional charge on most plans — but some plans require an additional fee you if you exceed your data limits. AT&T also includes hotspot access in most of its plans, with charges if you go over your monthly data limits. T-Mobile charges \$14.99 per month for mobile HotSpot access, allowing you to connect up to five devices at a time. While Sprint includes mobile hotspot access into some of its plans; if you go over the allotted data amount, you won't be charged extra, but it switches from 3G to 2G connectivity. [ Related story: How to use your Android device as a mobile hotspot ] Once you have confirmed with your mobile carrier that you can use your iPhone as a mobile hotspot, follow the steps below. Step 1 Go into your iPhone settings and tap "Personal Hotspot." Step 2 Toggle the switch to "ON." (Alternatively, you can go into your settings > cellular, and find the option to turn your hotspot on) Step 3 Create a password by tapping "Wi-Fi Password." Step 4 Decide if you want to tether your device to your iPhone using Wi-Fi, Bluetooth or USB. Connecting via Wi-Fi Go to the Wi-Fi settings on the device you want to tether to the iPhone, and find the connection listed as "iPhone." Connect to the network using the password you created in step 2. Connecting via Bluetooth Turn on the Bluetooth setting on the device you want to connect. Go to the settings on your iPhone and select "Bluetooth." Find the device you want to connect, and select it to pair. You might see a code appear on your tablet or notebook — you will need to enter that into your iPhone to connect. Connecting via USB Using the USB cable that came with your iPhone, plug it into your Mac or PC. Choose Phone from the list of Wi-Fi networks on your computer. Disconnecting devices If you want to disconnect devices, you can simply turn off your Personal Hotspot, turn off your Bluetooth or unplug the USB cable. Alternative for Apple users If you want to share your connection between multiple iOS devices associated with your account, an "Instant Hotspot" feature is already built into your iPhone. With Apple's Continuity feature, devices running iOS 8 or later can share a mobile connection with any of your other devices instantly, without turning on your personal hotspot. Always make sure you review your plan's data limits, so you know how much you will be charged if you go over. Once connected, the status bar on your iPhone will turn blue, and will display the number of devices that are using your Wi-Fi network. Make sure to set a strong password to keep your hotspot secure, especially if you are using it in a public place. Using your phone as a hotspot will drain your battery faster, especially if you connect wirelessly, so you'll want to make sure you can charge your iPhone if necessary. Checking your data usage If you're worried about going over your allotted monthly data, you can check on your data usage under settings > cellular directly on your iPhone. Alternatively, you can log into your Verizon, AT&T, Sprint or T-Mobile account and see how much data you have left for the month.
